

To Whom it may concern

I Leander Engelbrecht tested the pro sol Agrigrow product on litchi cutting that was in my nursery for about 7 months, we found a problem of scale and treated that with another product which eliminated the scale, but for more than 6 months we tried to get the trees to flush, even through the rainy season we did not manage to get the trees to flush, then we did a test with the product on 6 of the trees and 5 out of the 6 trees flushed within 3 weeks of starting with the product, this is now about 8 weeks into the trail and the other trees that have not been treated, up until now have not showed any signs of flush,

I will now start treating all the other trees with this product as I can see that it is beneficial to the small Litchi trees, which has no resistance to chemical fertilizer
